TZ For: how the blended spectrum is built, at the joint fit (T_1 4896 K, T_2 6396 K, R_1 8.28, R_2 3.94 $R_\odot$, geometry fixed at the literature values)
maximum separation — giant receding
secondary in front
φ = 0.250, Δv = -80 km s^{-1}
near conjunction — line systems blended
secondary behind
φ = 0.530, Δv = +15 km s^{-1}
maximum separation — giant approaching
secondary in front
φ = 0.767, Δv = +79 km s^{-1}
to observer
to observer
to observer
separations to scale, discs ×1.5
primary (K giant, 4896 K)
RV +57.3 km s^{-1}
RV +11.0 km s^{-1}
RV -20.3 km s^{-1}
secondary (6396 K)
RV -22.5 km s^{-1}
RV +26.2 km s^{-1}
RV +59.0 km s^{-1}
blended spectrum (normalised flux)
